<sup>1</sup>Estimated Standard Plate Count      =for Internal Use Only

Standard Plate Count performed using the WASP2 Spiral Plater set to dispense 50µL onto SMA and incubated at 32±2°C for 20-24 hours.

Salmonella detection procedure included enrichment of 1 mL of sample in 9 mL of TET or R10 and incubation at 41±2°C overnight. Incubated enrichment broth was streaked to appropriate agar which was incubated overnight at 36±2°C.

*E. coli* O157 procedure was performed by testing 1 mL of sample using immunomagnetic bead separation (IMS). 100 µL from the IMS procedure was then plated onto appropriate agar and incubated at 36±2°C overnight.

For Coliform enumeration, 1mL and 0.1mL of sample were plated to MAC and incubated overnight.

Tests were not designed to comply with the Standard Methods for the Examination of Milk Products.
