Standard Plate Count performed using the Spiral Plater set to dispense 50µL onto SMA and incubated at 32±2°C for 20-24 hours.  
 Salmonella detection procedure included enrichment of 1 mL of sample in 9 mL of TET or R10 and incubation at 41±2°C overnight. Incubated enrichment broth was streaked to appropriate agar which was incubated overnight at 36±2°C.

*E. coli* O157 procedure was performed by testing 1 mL of sample using immunomagnetic bead separation (IMS). 100 µL from the IMS procedure was then plated onto appropriate agar and incubated at 36±2°C overnight.

For Coliform enumeration, 1mL and 0.1mL of sample were plated to MAC and incubated at 36±2°C overnight.

Tests were not designed to comply with the Standard Methods for the Examination of Milk Products.
